RWorksheet_Condag#4c

Angel Blase

2024-11-02

- 1. Use the dataset mpg
- a. Show your solutions on how to import a csv file into the environment.

```
mpg <- read.csv("mpg.csv")</pre>
```

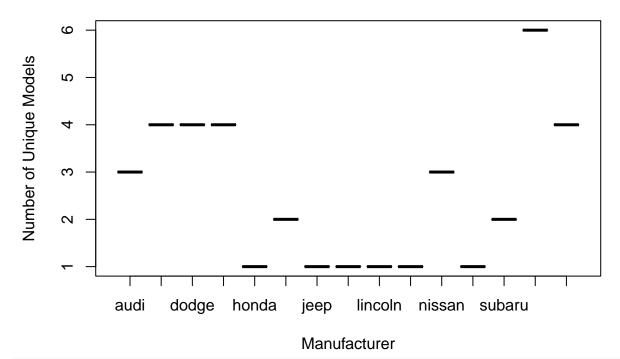

- b. Among the 11 variables in the mpg dataset from the ggplot2 package, the categorical variables include manufacturer, model, year, cyl, trans, drv, fl, and class.
- c. While the continuous variables are displ, hwy, and cty.
- 2. Which manufacturer has the most models in this data set? Which model has the most variations? Show your answer.

```
library(ggplot2)
##
## Attaching package: 'ggplot2'
## The following object is masked _by_ '.GlobalEnv':
##
##
       mpg
library(dplyr)
##

## 15 volkswagen
  b. Graph the result by using plot() and ggplot(). Write the codes and its result.
# Using plot()
manufacturer_models$manufacturer <- as.factor(manufacturer_models$manufacturer)
plot(manufacturer_models manufacturer, manufacturer_models unique_models,
     main = "Unique Models per Manufacturer",
     xlab = "Manufacturer",
     ylab = "Number of Unique Models",
     col = "pink",
```

pch = 19)

Unique Models per Manufacturer

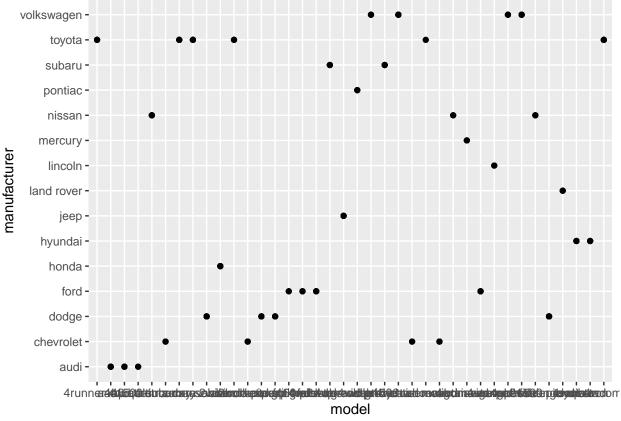

Unique Models per Manufacturer

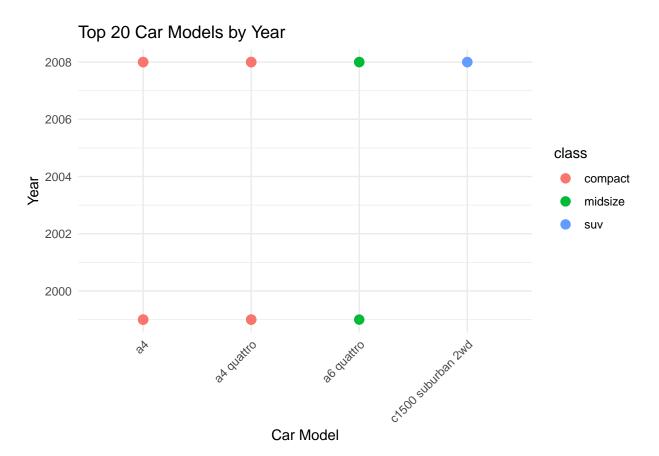

- 2. Same dataset will be used. You are going to show the relationship of the modeland the manufacturer.
- a. What does ggplot(mpg, aes(model, manufacturer)) + geom_point() show?

ggplot(mpg, aes(model, manufacturer)) + geom_point()

Using the code ggplot(mpg, aes(model, manufacturer)) + geom_point() creates a scatter plot with model on the x-axis and manufacturer on the y-axis. Each point on the plot represents a specific car model from the mpg dataset, plotted according to its associated manufacturer.

- b. The initial scatter plot created with ggplot(mpg, aes(model, manufacturer)) + geom_point() is not very useful because it displays a lot of overlapping points, making it hard to distinguish between different car models and their manufacturers. This clutter can obscure patterns and relationships in the data. To make the plot more informative, it could be enhanced by adding color to represent another variable, like the car class, which would provide more context. Additionally, adjusting the size of the points based on factors like highway miles per gallon would help convey more information.
- 3. Plot the model and the year using ggplot(). Use only the top 20 observations. Write the codes and its results.

4. Using the pipe (%>%), group the model and get the number of cars per model. Show codes and its result

```
model_counts <- mpg %>%
  group_by(model) %>%
  summarise(num_cars = n()) %>%
  arrange(desc(num_cars))
print(model_counts)
## # A tibble: 38 x 2
##
      model
                           num_cars
##
      <chr>
                              <int>
##
    1 caravan 2wd
                                 11
    2 ram 1500 pickup 4wd
                                 10

8 grand cherokee 4wd

a. Plot using geom_bar() using the top 20 observations only. The graphs should have a title, labels and colors. Show code and results.

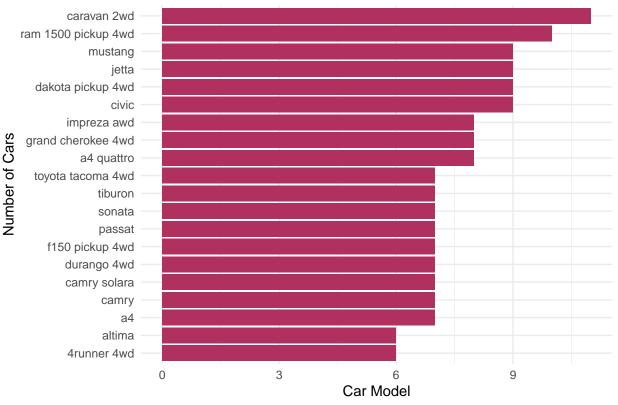

Top 20 Car Models by Number of Cars

Car Model

b. Plot using the geom_bar() + coord_flip() just like what is shown below. Show codes and its result.

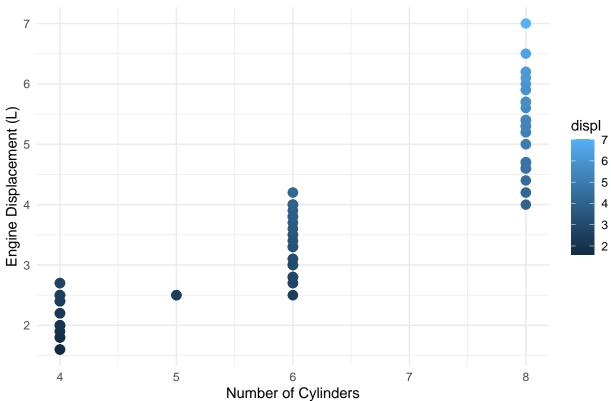

- 5. Plot the relationship between cyl number of cylinders and displ engine displacement using geom_point with aesthetic color = engine displacement. Title should be "Relationship between No. of Cylinders and Engine Displacement".
- a. How would you describe its relationship? Show the codes and its result.

```
ggplot(mpg, aes(x = cyl, y = displ, color = displ)) +
  geom_point(size = 3) +
  labs(title = "Relationship between No. of Cylinders and Engine Displacement",
        x = "Number of Cylinders",
        y = "Engine Displacement (L)") +
  theme_minimal()
```

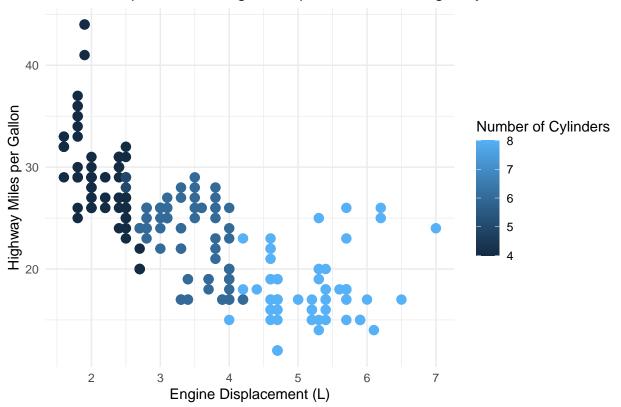

Discription: In the plot, I can see that as the number of cylinders goes up, the engine displacement also increases. This means cars with more cylinders tend to have bigger engines. The colors in the plot help show this pattern clearly.

6. Plot the relationship between displ (engine displacement) and hwy(highway miles per gallon). Mapped it with a continuous variable you have identified in #1-c. What is its result? Why it produced such output?

Relationship between Engine Displacement and Highway MPG

6. Import the traffic.csv onto your R environment.

```
traffic <- read.csv("traffic.csv")</pre>
```

a. How many numbers of observation does it have? What are the variables of the traffic dataset the Show your answer.

```
num_obs <- nrow(traffic)
variables <- colnames(traffic)
num_obs</pre>
```

[1] 48120

variables

```
## [1] "DateTime" "Junction" "Vehicles" "ID"
```

b. subset the traffic dataset into junctions. What is the R codes and its output?

```
traffic_by_junction <- traffic %>%
  group_by(Junction) %>%
  group_split()

traffic_by_junction
```

```
## tol_df<
## bl_df<
